## Change of variable method

#### Lemma 1

Let  $\phi$  denote a  $C^1$ -diffeomorphism from  $\mathcal{O} \subset \mathbb{R}^d$  to  $\mathcal{O}' \subset \mathbb{R}^d$  and  $g : \mathcal{O} \to \mathbb{R}$  an integrable function.

$$\int_{\mathcal{O}} g(v) dv = \int_{\mathcal{O}'} g \circ \phi^{-1}(u) |\det(\nabla \phi^{-1}(u))| du$$

## Change of variable method

#### Lemma 1

Let  $\phi$  denote a  $C^1$ -diffeomorphism from  $\mathcal{O} \subset \mathbb{R}^d$  to  $\mathcal{O}' \subset \mathbb{R}^d$  and  $g : \mathcal{O} \to \mathbb{R}$  an integrable function.

$$\int_{\mathcal{O}} g(v) dv = \int_{\mathcal{O}'} g \circ \phi^{-1}(u) |\det(\nabla \phi^{-1}(u))| du$$

#### Theorem 2 (Box-Müller)

Let U and V be two independent uniform random variables on [0, 1]. We set

$$X = \sqrt{-2\ln(U)}\cos(2\pi V),$$
  $Y = \sqrt{-2\ln(U)}\sin(2\pi V).$ 

Then,

$$(X, Y) \sim \mathcal{N}(0, I_2).$$

```
function [y1,y2] = randnorm(n) // assumes n even
m = n/2
x1 = rand(1,m)
x2 = rand(1,m)
y1 = sin(2*%pi*x1).*sqrt(-2*log(x2));
y2 = cos(2*%pi*x1).*sqrt(-2*log(x2));
endfunction
```

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

```
-->x = randnorm(10000);
-->histplot(100,x)
```

```
function [y1,y2] = randnorm(n) // assumes n even
m = n/2
x1 = rand(1,m)
x2 = rand(1,m)
y1 = sin(2*%pi*x1).*sqrt(-2*log(x2));
y2 = cos(2*%pi*x1).*sqrt(-2*log(x2));
endfunction
-->x = randnorm(10000);
-->histplot(100,x)
We can compare the histogram to exact density:
```

#### Theorem 3

Let  $\mu \in \mathbb{R}^d$  and  $\Gamma \in S_d^+$  a  $d \times d$  definite positive symmetric matrix.

• By Cholesky's algorithm, there exists a lower triangular matrix  $A \in \mathbb{R}^{d \times d}$  such that  $\Gamma = AA^T$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

• If  $G \sim \mathcal{N}(0, I_d)$ , then  $\mu + AG \sim \mathcal{N}(\mu, \Gamma)$ 

#### Theorem 3

Let  $\mu \in \mathbb{R}^d$  and  $\Gamma \in S_d^+$  a  $d \times d$  definite positive symmetric matrix.

- By Cholesky's algorithm, there exists a lower triangular matrix  $A \in \mathbb{R}^{d \times d}$  such that  $\Gamma = AA^T$
- If  $G \sim \mathcal{N}(0, I_d)$ , then  $\mu + AG \sim \mathcal{N}(\mu, \Gamma)$

#### Exercise

For  $\rho \in [-1, 1]$ , simulate a sample of size *n* of centred Gaussian couple  $(G_1, G_2)$  with covariance matrix  $\begin{pmatrix} 1 & \rho \\ \rho & 1 \end{pmatrix}$ .

```
function [] = gaussian_vector(rho)
if abs(rho) >1
disp('the correlation must be between -1 and 1 !')
disp('aborting...')
return
end
n=1000;
[g1,g2]=randnorm(n) ;
Gamma=[1,rho;rho,1];
A=chol(Gamma);
z=A*[g1;g2];
x=z(1,:);
y=z(2,:);
plot2d(x,y,-1)
endfunction
```

# Outline

Monte Carlo method is based on the Large Law numbers

#### Theorem <u>4</u>

SLLN Let  $(X_n)_{n\geq 1}$  be a sequence of i.i.d. random variables with the same law as X. If  $\mathbb{E}|X| < \infty$  then

$$S_n := rac{1}{n} \sum_{i=1}^n X_i \xrightarrow[n \to \infty]{} \mathbb{E}X, \ a.s.$$

The convergence holds also in  $L^1$ 

Let us assume that  $\mathbb{E}X = 0$  and  $\mathbb{E}|X|^4 < \infty$ .

#### Proof.

$$\mathbb{E}S_n^4 = \frac{1}{n^4} \left( \sum_{k=1}^n \mathbb{E}(X_k^4) + 6 \sum_{i < j} \mathbb{E}(X_i^2) \mathbb{E}(X_j^2) \right)$$
$$= \frac{1}{n^4} \left( n \mathbb{E}(X^4) + 3n(n-1) \mathbb{E}(X^2)^2 \right)$$
$$\leq \frac{3 \mathbb{E}(X^4)}{n^2}$$

By the monotone convergence Theorem we deduce  $\mathbb{E}(\sum_{n=1}^{\infty} S_n^4) < \infty$  which implies that  $\sum_{n=1}^{\infty} S_n^4 < \infty$  a.s. This completes the proof.

#### Theorem 5

Let  $(X_n)_{n\geq 1}$  be a sequence of independent random copies of X. If  $\mathbb{E}(|X|^3) < \infty$ , then

$$\sqrt{n}\left(rac{1}{n}\sum_{i=1}^{n}X_{i}-\mathbb{E}X
ight) \Rightarrow \mathcal{N}(0,\sigma^{2}), \quad \text{ as } n 
ightarrow \infty$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

where  $\sigma^2 = \operatorname{Var}(X)$ .

## Sketch of the proof

• Without a loss of generality we can consider the case where  $\mathbb{E}(X) = 0$  and d = 1. This implies that  $Var(X) = \mathbb{E}(X^2) = \sigma^2$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### Sketch of the proof

• Without a loss of generality we can consider the case where  $\mathbb{E}(X) = 0$  and d = 1. This implies that  $Var(X) = \mathbb{E}(X^2) = \sigma^2$ .

We set

$$\bar{S}_n := \frac{1}{n} \sum_{i=1}^n X_i$$

and compute the characteristic function associated to  $\sqrt{n}S_n$ .

### Sketch of the proof

• Without a loss of generality we can consider the case where  $\mathbb{E}(X) = 0$  and d = 1. This implies that  $Var(X) = \mathbb{E}(X^2) = \sigma^2$ .

We set

$$\bar{S}_n := \frac{1}{n} \sum_{i=1}^n X_i$$

and compute the characteristic function associated to  $\sqrt{n}S_n$ .

• For all 
$$u \in \mathbb{R}$$

$$\psi_{\sqrt{n}S_n}(u) := \mathbb{E}\left[\exp(iu\sqrt{n}S_n)\right] = \left(\mathbb{E}\left[\exp\left(\frac{iuX}{\sqrt{n}}\right)\right]\right)^n$$

By Taylor expansion

$$\left|e^{iy} - 1 - iy + \frac{y^2}{2}\right| \le \min\left(\frac{|y|^3}{6}, y^2\right).$$

• Then it follows that

$$\exp\left(\frac{iuX}{\sqrt{n}}\right) = 1 + \frac{iuX}{\sqrt{n}} - \frac{u^2X^2}{2n} + h_n(X), \text{ where}$$
$$|h_n(X)| \le \frac{u^2}{n} \min\left(\frac{u|X|^3}{6\sqrt{n}}, X^2\right)$$

• Note that the sequence  $(nh_n(X))_n$  is uniformly dominated by  $u^2X^2$  and

$$\mathbb{E}\left[\exp\left(\frac{iuX}{\sqrt{n}}\right)\right] = 1 - \frac{u^2\sigma^2}{2n} + \mathbb{E}[h_n(X)],$$

• Thnaks to the Dominated convergence theorem we get

 $\lim_{n\to\infty}\mathbb{E}[nh_n(X)]=0$ 

We deduce that

$$\lim_{n \to \infty} \mathbb{E}\left[\exp\left(\frac{iuX}{\sqrt{n}}\right)\right] = \lim_{n \to \infty} \left(1 - \frac{u^2\sigma^2}{2n} + o(n^{-1})\right)^n$$
$$= \exp\left(-\frac{u^2\sigma^2}{2}\right)$$
$$= \mathbb{E}[\exp(iuG)]$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

where  $G \sim \mathcal{N}(0, 1)$ 

We consider a sample  $(Z_1, \ldots, Z_n)$  with  $Z_i$  sont i.i.d random variables with the same law as  $\sqrt{12p} \left(\frac{1}{p} \sum_{i=1}^{p} U_i - \frac{1}{2}\right)$ , the random variables  $(U_i, i \leq p)$  are i.i.d with uniform distribution on the interval [0, 1]. Use the following function to plot the histogram of  $(Z_i, i \leq n)$  with *nc* classes. Vary *n*, *p*, *nc* we can take p = 1, p = 12 with large and small values of *nc*. We will take *n* of order 1000.

(日) (同) (三) (三) (三) (○) (○)

```
function [] = tcl(n, p, nc)
X=rand(n,p);
Z=sqrt(12/p)*(sum(X,'c') - p/2); // sum of columns,
centred and renormalised
histplot(nc,Z)
C=[-5:1/1000:5];
plot2d(C,exp(-C.^ 2/2)/sqrt(2*%pi),3) // plobability
density of standad distribution
endfunction
```
